

Comparative test of additives for GREX frying oil at the Food Research Laboratory in Taiwan

- Add the same amount of oil to the pan.
- Every 30 minutes under the same conditions.
- Deep fry frozen chicken nuggets.
- No additional oil.

- A is GREX-added oil
- B is no-added oil

After the test, the amount of oil left in the pan was in a beaker because of the large difference. The difference in quantity showed that the GREX-added oil in A remained more than twice as much as the oil without additives in B.

This results proved that the amount of the additional oil is reduced by half.

The color of A remained stable throughout, but the color of B became darker than the fourth time.
